Jefferson, Wisconsin – Renew Energy, Wisconsin's newest and largest ethanol plant, and ZFS Ingredients of Zeeland Michigan have joined forces to form an alliance for the marketing of Renew's livestock feed products.

"We are excited to be marketing this great new line-up of feed products," said Dan Meeuwsen, executive at ZFS. "Renew Meal especially will be a big hit with dairy farmers."

Renew Energy plans to begin production this month at its 130 million gallon-per-year ethanol plant. The plant will feature the world's largest dry fractionation mill, yielding a completely different set of co-products than the traditional ethanol plant.

The plant will produce Renew Meal™, Corn Germ, and Corn Bran while producing ethanol much more efficiently than a traditional plant.

"Farmers may be surprised to learn from ZFS that they now will have more ration options than ever before," said Scott Busch, director of co-products marketing for Renew.

The plant will use state-of-the-art environmental technology, capturing carbon dioxide and minimizing emissions well below regulatory limits.

ZFS Ingredients, a division of Zeeland Farm Services, Inc. (ZFS), has provided quality feed ingredients to the livestock industry for over a decade. A full contingent of merchandisers and staff will be located in Jefferson, Wisconsin in addition to merchandisers and support staff at ZFS' corporate office in Zeeland, Michigan,

ZFS has over 55 years of service in the agricultural and transportation industries. ZFS' wide array of specialty products and services include feed ingredients, grain marketing, a full-service elevator, soybean seeds, GMO (Genetically Modified Organism) and non-GMO soybean meal, vegetable oils, biodiesel, and transportation and maintenance.

"We plan to provide producers with high quality feed at very competitive prices," concluded Meeuwsen.
